

Lime industry

A lime kiln produces quicklime when limestone is calcinated. To achieve this the rotary kiln must reach a temperature upwards of over 1000°C. Refractory bricks are designed to reduce thermal losses and the consumption of energy. Kiln lining refractories improve insulation, reduce maintenance costs, and improve safety while keeping downtime to a minimum.

ASFOUR REFRACTORIES has been offering our customers a wide range of refractory and insulation solutions to serve our Lime industry customers around the region. Our ability to offer quality and customized solutions has helped us set our footprints in the Lime industry.
